

Instructions for folding the 7-faced tetraflexagon

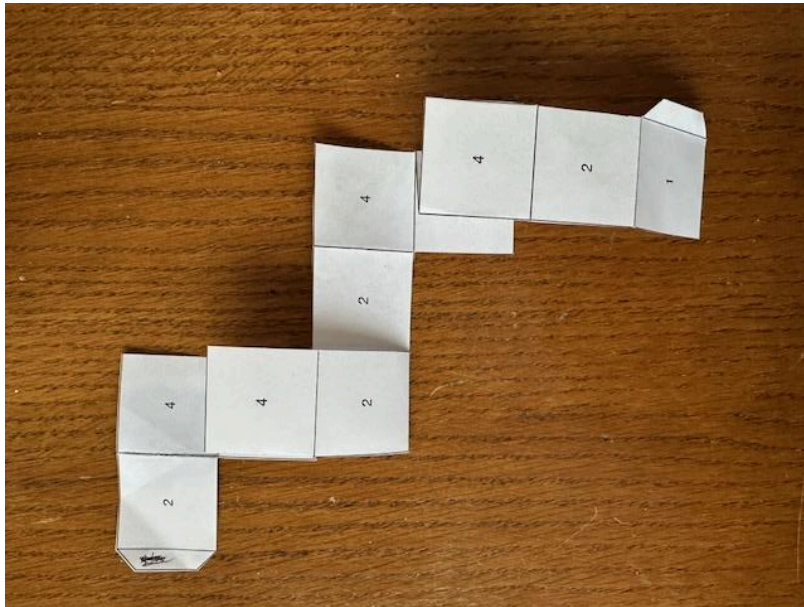

1. Print out the template (double-sided). Note that the numbering will not be the same on both sides! Cut around the edges so that you have a single wandering path of numbered squares.
3. Pre-crease along all the boundaries between squares. (This will help with folding!)
4. Start the folding by folding adjacent 7s together (on both sides) so that the 7s are touching:

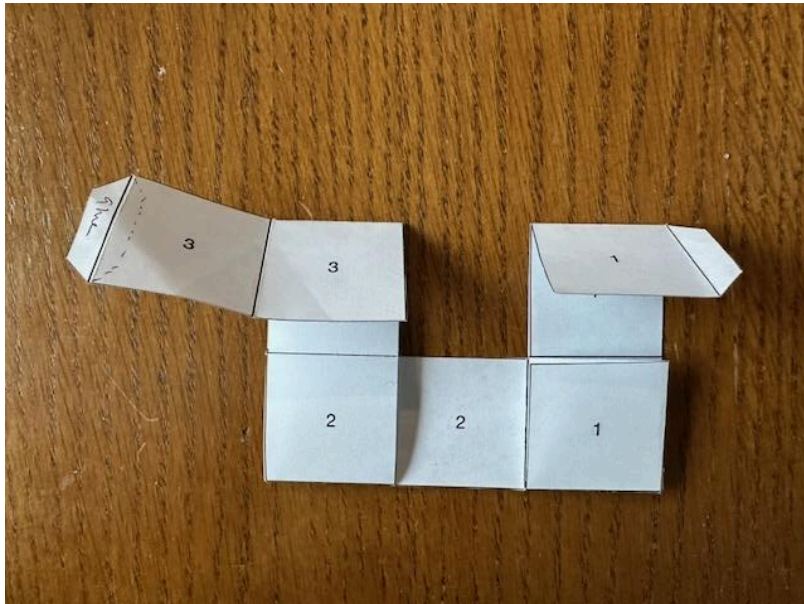

5. Continue by folding together adjacent 6s, then 5s, then 4s, then 3s. After the 6s:

After you've folded together the 5s:

And after folding the 4s:

6. After folding the 3s together, you should have a square with 2s showing on one side and 1s showing on the other side. The two glue tabs should be sticking out towards each other, and if you peek inside the folds next to the glue tabs, you should see the outline showing where they should be glued down.

7. Carefully and sparingly apply glue over the word “glue” on both glue tabs. Then tuck each tab into place so that the glued surface aligns with the space marked by the dotted outline. Press gently and let dry.

8. Try manipulating your flexagon!

About the 7-faced tetraflexagon

This form has seven faces, each consisting of four squares. If you use the template, each face will have four of the same number on it (four 7s, four 6s, etc.). As you manipulate the flexagon, you'll see that the orientation of those four squares can change, relative to each other, and also the path by which you access the different faces can vary.

This form suggests different possibilities:

- mirror images that change their relationship
- sequences that get disrupted
- whole images or texts that are sectioned into pieces
- individual images or texts that come together in quasi-kaleidoscopic ways
